March 12rd, 2019,

Dear Arbiter Software,

I am interested in the job offering by Arbiter Software for the entry level software developer position. I saw it advertised on Indeed.com and believe I have the qualifications necessary to fulfill the job requirements. I am currently employed as a Field Engineer for Zerma, a world-wide distributor of large industrial machinery for factories. While my current position does not require much use of my higher-end technical skills beyond maintaining computers and keeping various technologies up to date, my past college and freelance programming experiences have given me the tools to fulfill your needs.

I have geared my education and personal projects towards becoming a software developer. As such, my technical expertise include 12 different programming/scripting languages (C#, C, .Net, SQL, Java and Python) and knowledge of cross platform applications, tools and best practices usable on both WIndows and Linux (OOD, SCRUM/AGILE, client/server architecture, test driven development). I've become proficient in working with and using all of the above skills. Additionally, I have excellent verbal communication and a good understanding of hardware level systems.

My resume is attached to the application. I hope you visit my website where I've listed three projects available through GitHub. I look forward to talking about the possibilities of us working together.
